

**PYRIDYLOXYMETHYL AND BENZISOXAZOLE AZABICYCLIC DERIVATIVES**

This application claims priority under 35 USC 119(e) of US Provisional 60/453,925, filed March 12, 2003.

**Field of the Invention**

5       The invention pertains to aminomethylpyridyloxymethyl/benzisoxazole substituted azabicyclic compounds that, among other things, can singly serve as an effective 5-HT1B, 5-HT2A and D2 receptor inhibitor, e.g. antagonist, inverse agonist and/or partial agonist. The invention also relates to an intermediate for preparation of said compounds; a pharmaceutical composition comprising said compounds; and the use of said compounds or other  
10      compounds having said effective 5-HT1B, 5-HT2A and D2 receptor binding or inhibition in a method for treating certain CNS or other disorders.

**Background of the Invention**

Disorders of the Central Nervous System (CNS) can be medically treated in various ways. Of increasing importance in this regard are psychotropic drugs. But while such drugs  
15      have therapeutic effect, they also may cause unwanted and serious side effects. For example, schizophrenia can be treated with so-called typical drugs, which have been theorized to block certain dopamine (D2) receptors in the brain thought responsible for the positive symptoms of delusions, disordered thinking and the like. However, while these drugs can ameliorate some of the positive symptoms, they can also adversely affect the motor  
20      system, causing muscle problems such as spasms, cramps, tremors and Parkinsonism. Inasmuch as these types of side effects --generally characterized as Extrapyramidal Symptoms (EPS)-- can be severe enough to disrupt daily activities, resort has been made to so-called atypical drugs.

Atypical antipsychotics have reduced incidents of EPS and can alleviate not only  
25      some of the positive symptoms of schizophrenia, but some of the negative symptoms as well, such as emotional unresponsiveness, social withdrawal and the like. Although antipsychotic drugs are believed to be more selective in their chemical effect on the brain, thereby reducing EPS, they too may have side effects. While these are not often as disruptive as those presented by typical drug therapy, they may nonetheless be of consequence to the patient.  
30      For example, atypical drugs can be sedating and can cause weight gain.

The situation is further complicated when several CNS disorders are present in a patient. For example, psychosis, such as schizophrenia, can often co-exist with depression, anxiety, obsessive-compulsive disorder (OCD) and other such illnesses. In such cases, treatment often entails the administration of a combination of drugs, e.g., one to treat  
35      schizophrenia and one to treat depression or other co-morbid CNS ailment. Because each such drug has its own side effects, the combined administration can lead to a multiplication or

**EXPRESS MAIL**

EV 323 552 521 US

enhancement of same, all to the detriment of the patient. Moreover, it is theorized that a different brain receptor, or combination or permutation of receptors, are somehow implicated in each of the various CNS disorders; for example, schizophrenia has been thought to involve D2 and 5HT-2A receptors whereas depression has been associated with 5HT-1B receptors.

5 A class of aminomethylphenoxyethyl/benzisoxazole substituted azabicyclic compounds, useful as selective agonists and antagonists of serotonin 1 (5-HT1) receptors, is described in WO 99/52907 to Bright.

It has hitherto proven difficult to find a single drug that can treat a patient suffering from diverse CNS disorders where a plurality of different receptors are in play. Accordingly, 10 there is an on-going need for a psychotropic drug that has a pronounced reduction in side effects, and that can efficaciously and by itself treat multiple CNS disorders in which an antagonist or agonist to different receptors is indicated. Specifically, it would be desirable to find a drug that can concurrently treat schizophrenia and depression in which D2, 5HT-2A and 5HT-1B receptors are involved.

15 Summary of the Invention

The present invention addresses the aforesaid needs. In one aspect, the invention relates to a compound having the following formula, denoted herein as Formula I:

or the (R) or (S) enantiomer thereof, or the *cis* or *trans* isomer thereof, or a pharmaceutically acceptable salt, solvate or prodrug thereof or of any of the foregoing, wherein m is 0 or 1; Z is

wherein R<sup>7</sup> is hydrogen or (C<sub>1</sub>-C<sub>3</sub>)alkoxy; R<sup>8</sup> is hydrogen, hydroxy, or (C<sub>1</sub>-C<sub>3</sub>)alkoxy; and R<sup>9</sup> is (C<sub>1</sub>-C<sub>3</sub>)alkoxy;

(ii) a 4 to 10 membered optionally unsaturated polycyclic ring, wherein said monocyclic or polycyclic ring optionally has one or two additional heteroatoms selected from nitrogen, oxygen and sulfur,

20 wherein any of said rings (i) or (ii) may be unsubstituted or substituted with one or more (C<sub>1</sub>-C<sub>4</sub>)alkyl, (C<sub>1</sub>-C<sub>4</sub>)alkoxy, (C<sub>1</sub>-C<sub>4</sub>)alkoxy(C<sub>1</sub>-C<sub>4</sub>)alkyl, (C<sub>3</sub>-C<sub>7</sub>)cycloalkyl, (C<sub>6</sub>-C<sub>10</sub>)aryl, (C<sub>7</sub> to C<sub>13</sub>)aralkyl, a 5 to 10 membered heteroaryl, hydroxy, amino, cyano, or halogen groups.

In other aspects, the invention relates to a pharmaceutical composition comprising said compound; and to a method of treating one or more CNS disorders wherein a ligand, for example, an antagonist, partial agonist (with 80% or more antagonism), or inverse agonist, to 25 D2, 5HT-2A and 5HT-1B receptors, individually or any combination thereof, is indicated. The invention also pertains in part to a compound manifesting a ratio of D2 : 5HT1B receptor binding of about 20 or less; and/or inhibitory activity to each of said D2, 5HT1B and 5HT2A receptors.

30 Compounds of the invention have receptor binding activity to at least two and preferably all three of the D2, 5HT1B and 5HT2A receptors. The level of inhibition in this regard is such that the compound of the invention is therapeutically effective to treat CNS disorder(s) in a mammal wherein activity against all of these receptors, is indicated. This

EXPRESS MAIL

EV 323552521 US

means that the compound has an effective Ki of less than or equal to 20 nM at all three receptors.

Furthermore, the invention preferably comprises any compounds with an intrinsic efficacy of an antagonist and/or inverse agonist at human D2, human 5HT1B and human 5HT2A receptors. The intrinsic efficacy as measured by adenylate cyclase activity , phosphoinositol turnover, or other methods known in the art. No prior art compound displays antagonist or inverse agonist activity at all three receptors. More specifically, the invention preferably comprises compounds with an intrinsic efficacy of an antagonist and/or inverse agonist at human D2 and human 5HT2A receptors and an intrinsic efficacy of an antagonist >-80% at human 5HT1B receptors. As above, the intrinsic efficacy may be measured by adenylate cyclase activity or phosphoinositol turnover.

The invention preferably comprises compounds with a functional Ki value at 5HT1B of less than or equal to 5 nM in combination with a functional Ki value of less than or equal to 20 nM at human D2 and human 5HT2A receptors

15 Furthermore, the invention preferably comprises compounds that can singly show *in vivo* efficacy in animal models of 5HT1B, D2, and 5HT2A antagonism or inverse agonism. Representative animal models include the following examples but are not limited to such models. Compounds are tested for their ability to antagonize the hypothermia response produced by a 5-HT1B agonist as a measure of *in vivo* 5-HT1B antagonist activity. 20 Compounds or vehicle are administered to guinea pigs, 0 to 60 minutes subcutaneous (sc) prior to the 5-HT1B agonist and body temperatures are monitored over a four hour period after agonist administration. The present invention preferably comprises compounds with an ID<sub>50</sub> of less than or equal to 1 mg/kg, sc in hypothermia.

In another animal model, compounds are tested for their ability to antagonize DOI (drug interaction) -induced head twitches as a measure of *in vivo* 5-HT2A antagonist activity. Administration of the 5-HT2A agonist, DOI, elicits a characteristic head shaking behavior (head twitch) that has been attributed to activation of 5-HT2A receptors. Compounds or vehicle are administered to habituated rats, 30 to 60 min sc prior to 3.2 mg/kg DOI, and head twitches are counted over a 30 min test period. The invention preferably comprises 30 compounds with an ID<sub>50</sub> of less than or equal to 10 mg/kg, sc in 5HT2A head twitch.

In addition, compounds are tested for their ability to antagonize d-amphetamine-induced hyperactivity as a measure of *in vivo* dopamine D2 receptor antagonist activity. Administration of low doses of the indirect dopamine agonist, d-amphetamine, produces a dramatic increase in horizontal locomotor activity in rats, a phenomenon which has been 35 attributed to activation of the mesolimbic dopamine system, and which therefore provides a rodent model of the hyperdopaminergic activity implicated in schizophrenia. Compounds or

vehicle are administered to habituated rats, 30-60 min s.c. prior to 1.0 mg/kg of d-amphetamine SO<sub>4</sub>, and locomotor activity data are recorded in computer-monitored activity chambers for the 3 hour duration of the hyperactivity response. The invention includes compounds with an ID<sub>50</sub> of less than or equal to 10 mg/kg, sc in d-amphetamine locomotor activity.

Detailed Description of the Invention

In one embodiment, the invention is directed to a compound having *inter alia* binding activity to one or multiple receptors, including D2, 5HT1B and 5HT2A receptors, individually or any combination thereof. In preferred embodiment, the compound has binding activity (based on e.g. IC<sub>50</sub> or Ki) to D2 and 5HT1B receptors in a ratio of D2: 5HT1B of about 20 or less; in more preferred practices, this ratio is about 10 or less; about 5 or less; most preferably about 1.

Unless otherwise indicated, the term "inhibitory activity" and related variations of same as used herein means that the compound serves, without limitation, as an antagonist, inverse agonist and/or partial agonist (80% antagonism or more) and the like to any of the receptors indicated herein; for example, the compound exhibits a binding affinity with a Ki of about 1 micromolar or less, with preferred practices having a Ki of about 100 nanomolar (nM) or less, about 50 nM or less, about 20nM or less, and most preferably about 10 nM or less, for any of the receptors aforesaid.

In an exemplifying embodiment, the compound of the invention has Formula I, above, including pharmaceutically acceptable salts thereof, e.g. acid addition salts, base addition salts, and prodrugs and solvates thereof. Without limitation, examples of pharmaceutically acceptable acid addition salts of the compounds of Formula I are the salts of hydrochloric acid, p-toluenesulfonic acid, fumaric acid, citric acid, succinic acid, salicylic acid, oxalic acid, hydrobromic acid, phosphoric acid, methanesulfonic acid, tartaric acid, malate, di-p-toluoyl tartaric acid, and mandelic acid. Other possible acid addition salts are, e.g., salts containing pharmaceutically acceptable anions, such as the hydroiodide, nitrate, sulfate or bisulfate, phosphate or acid phosphate, acetate, lactate, gluconate, saccharate, benzoate, methanesulfonate, ethanesulfonate, benzenesulfonate, and pamoate (*i.e.*, 1,1'-methylene-bis-(2-hydroxy-3-naphthoate) salts).

The compound of Formula I may have optical centers (e.g., at the 7 and 9a positions indicated) and thus may occur in different enantiomeric configurations. The invention includes all enantiomers, diastereomers, and other stereoisomers and optical isomers of such compound of Formula I, as well as racemic and other mixtures thereof. For example, the compound of Formula I includes (R) and (S) enantiomers and *cis* and *trans* isomers. The present invention further includes all radiolabelled forms of the compound of the Formula I.

Preferred radiolabelled compounds are those wherein the radiolabels are selected from as  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{14}\text{C}$ ,  $^{18}\text{F}$ ,  $^{123}\text{I}$  and  $^{125}\text{I}$ . Such radiolabelled compounds are useful as research and diagnostic tools in metabolism pharmacokinetics studies and in binding assays in animals and man. In another embodiment, the invention is directed to a compound of Formula I wherein in an assay of D2, 5HT1B or 5HT2A binding said compound exhibits a Ki with intrinsic efficacy of about 1 micromolar or less; preferably exhibiting Ki's of about 100 nanomolar (nM) or less, about 50 nM or less, about 20nM or less, and most preferably about 10 nM or less. The assays in this regard are those known in or adaptable from the art.

The present invention is also directed to a pharmaceutical composition comprising the compound of the invention; and a pharmaceutically acceptable carrier.

Unless otherwise indicated, the following terms and related variations of same as used herein representatively have the meanings ascribed:

"Halogen" and "halo" and the like includes fluoro, chloro, bromo and iodo.

"Alkyl" including as appears in the terms "alkoxy," "alkyoxyalkyl," and "aralkyl," includes saturated monovalent hydrocarbon radicals having straight or branched moieties. Examples of alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, isopropyl, and t-butyl.

"Methylene" refers to the divalent radical —(CH<sub>2</sub>)<sub>p</sub>— where p is 1 (methylene), 2 (dimethylene) or 3 (trimethylene).

"Cycloalkyl" includes non-aromatic saturated cyclic alkyl moieties wherein alkyl is as defined above. Examples of cycloalkyl include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, and cycloheptyl; and bicycloalkyl and tricycloalkyl groups that are non-aromatic saturated carbocyclic groups consisting of two or three rings respectively, wherein said rings share at least one carbon atom. For purposes of the present invention, and unless otherwise indicated, bicycloalkyl groups include spiro groups and fused ring groups. Examples of bicycloalkyl groups include, but are not limited to, bicyclo-[3.1.0]-hexyl, bicyclo—2.2.1-hept-1-yl, norbornyl, spiro[4.5]decyl, spiro[4.4]nonyl, spiro[4.3]octyl, and spiro[4.2]heptyl. An example of a tricycloalkyl group is adamantanyl. Cycloalkyl groups also include groups that are substituted with one or more oxo moieties. Examples of such groups with oxo moieties are oxocyclopentyl and oxocyclobutyl.

"Aryl" includes an organic radical derived from an aromatic hydrocarbon by removal of one hydrogen, such as phenyl, naphthyl, indenyl, indanyl, and fluorenyl; and fused ring groups wherein at least one ring is aromatic.

"Heterocyclic" refers to a cyclic group containing one or more heteroatoms, preferably from one to four heteroatoms, each selected from O, S and N. Heterocyclic groups also include ring systems substituted with one or more oxo moieties. Examples of heterocyclic groups are aziridinyl, azetidinyl, pyrrolidinyl, piperidinyl, azepinyl, piperazinyl, 1,2,3,6-tetrahydropyridinyl, 5 oxiranyl, oxetanyl, tetrahydrofuranlyl, tetrahydrothienyl, tetrahydropyranyl, tetrahydrothiopyranyl, morpholino, thiomorpholino, thioxanyl, pyrrolinyl, indolinyl, 2H-pyranyl, 4H-pyranyl, dioxanyl, 1,3-dioxolanyl, pyrazolinyl, dihydropyranyl, dihydrothienyl, dihydrofuranyl, pyrazolidinyl, imidazolinyl, imidazolidinyl, 3-azabicyclo[3.1.0]hexanyl, 3-azabicyclo[4.1.0]heptanyl, quinolizinyl, quinuclidinyl, 1,4-dioxaspiro[4.5]decyl, 1,4-dioxaspiro[4.4]nonyl, 1,4-dioxa-spiro[4.3]octyl, and 1,4-dioxaspiro[4.2]heptyl.

"Heteroaryl" refers to aromatic groups containing one or more heteroatoms (O, S, or N), preferably from one to four heteroatoms. A multicyclic group containing one or more heteroatoms wherein at least one ring of the group is aromatic is a "heteroaryl" group. The heteroaryl groups of this invention can also include ring systems substituted with one or more oxo moieties. Examples of heteroaryl groups are pyridinyl, pyridazinyl, imidazolyl, pyrimidinyl, pyrazolyl, triazolyl, pyrazinyl, quinolyl, isoquinolyl, 1,2,3,4-tetrahydroquinolyl, tetrazolyl, furyl, thieryl, isoxazolyl, thiazolyl, oxazolyl, isothiazolyl, pyrrolyl, indolyl, benzimidazolyl, benzofuranyl, cinnolinyl, indazolyl, indolizinyl, phthalazinyl, triazinyl, 1,2,4-trizainyl, 1,3,5-triazinyl, isoindolyl, 1-oxoisoindolyl, purinyl, oxadiazolyl, thiadiazolyl, furazanyl, 20 benzofurazanyl, benzothiophenyl, benzotriazolyl, benzothiazolyl, benzoxazolyl, quinazolinyl, quinoxalinyl, naphthyridinyl, dihydroquinolyl, tetrahydroquinolyl, dihydroisoquinolyl, tetrahydroisoquinolyl, benzofuryl, furopyridinyl, pyrolopyrimidinyl, and azaindolyl.

The foregoing groups, as derived from the compounds listed above, may be bonded via a C atom or N atom where such is possible. For instance, a group derived from pyrrole may be 25 pyrrol-1-yl (bonded via N) or pyrrol-3-yl (bonded via C). The terms referring to the groups also encompass all possible tautomers.

"Amino" includes moieties of the formula -NR<sup>5</sup>R<sup>6</sup> wherein R<sup>5</sup> and R<sup>6</sup> are each independently hydrogen or (C<sub>1</sub>-C<sub>4</sub>)alkyl.

"Treatment" and "treating" refers to reversing, alleviating, inhibiting the progress of, or preventing the disorder or condition to which such term applies, or one or more symptoms of such condition or disorder. As used herein, the term also encompasses, depending on the condition of the patient, preventing the disorder, including preventing onset of the disorder or of any symptoms associated therewith, as well as reducing the severity of the disorder or any of its symptoms prior to onset. "Treating" as used herein refers also to preventing a 35 recurrence of a disorder. The term "treatment", as used herein, refers to the act of treating, as "treating" is defined immediately above.

EXPRESS MAIL  
EV 323552 5/21 115

For example, "treating schizophrenia, or schizophreniform or schizoaffective disorder" as used herein also encompasses treating one or more symptoms (positive, negative, and other associated features) of said disorders, for example treating, delusions and/or hallucination associated therewith. Other examples of symptoms of schizophrenia and  
5 schizophreniform and schizoaffective disorders include disorganized speech, affective flattening, alogia, anhedonia, inappropriate affect, dysphoric mood (in the form of, for example, depression, anxiety or anger), and some indications of cognitive dysfunction.

"Mammal" refers to any member of the class "Mammalia", including, but not limited to, humans, dogs, and cats.

10 "Modulating serotonergic neurotransmission" refers to increasing or improving, or decreasing or retarding the neuronal process whereby serotonin is released by a pre-synaptic cell upon excitation and crosses the synapse to stimulate or inhibit the post-synaptic cell.

15 "Chemical dependency" means an abnormal craving or desire for, or an addiction to a drug. Such drugs are generally taken by the affected individual by any of a variety of means, including oral, parenteral, nasal or by inhalation. Examples of chemical dependencies treatable by the methods of the present invention are dependencies on alcohol, nicotine, cocaine, heroin, phenobarbital, and benzodiazepines (e.g. Valium ®). "Treating a chemical dependency" as used herein, means reducing or alleviating such dependency and/or the craving therefor.

20 The invention provides a method of treating one or more CNS disorders in a mammal, including a human, in need of such treatment. Without limitation, CNS disorders in this regard are those wherein a ligand to D2, 5HT1B and 5HT2A receptors, individually or in any combination, is indicated. In one aspect, the method comprises administering a therapeutically effective amount of a compound that is an inhibitor to at least two of the  
25 following receptors: D2, 5HT-1B and 5HT2A. In another aspect of the invention, the method comprises administering a therapeutically effective amount of a D2/5HT1-B/5HT-2A inhibitor. In yet another aspect, the method comprises administering a therapeutically effective amount of a D2/5HT1B inhibitor having a ratio of D2 : 5HT1B inhibitory activity of about 20 or less, it being preferred that said ratio is about 10 or less; about 5 or less; and most preferably about  
30 1. In a preferred practice, the inhibitor administered for treatment pursuant to the method of the invention has the structure of Formula I.

35 CNS disorders subject of the invention are those known in the art; and include without limitation those wherein a ligand, e.g. an antagonist, an inverse agonist and/or a partial agonist and the like, to D2, 5HT1B, and 5HT2A receptors, either individually or any combinations thereof, are indicated. Thus in a preferred practice, the invention can treat one or more CNS disorders with a single compound; for example, the invention can treat

schizophrenia, wherein inhibition of D2 and 5HT2A receptors is commonly indicated, and depression wherein inhibition of 5HT1B receptors is commonly indicated.

The compound of the invention can also be used in combination with other drugs, e.g. those conventionally used to treat any of the CNS disorders herein described. For example, 5 the compound of the invention can be used in combination with ziprasidone and like compounds to treat schizophrenia; or with a 5HT re-uptake inhibitor and like compounds to treat depression.

CNS disorders contemplated for treatment by the present invention include, without limitation:

10 Anxiety or psychotic disorders such as: schizophrenia, for example of the paranoid, disorganized, catatonic, undifferentiated, or residual type; schizopreniform disorder; schizoaffective disorder, for example of the delusional type or the depressive type; delusional disorder; substance-induced psychotic disorder, for example psychosis induced by alcohol, amphetamine, cannabis, cocaine, hallucinogens, inhalants, opioids, or phencyclidine; 15 personality disorder of the paranoid type; and personality disorder of the schizoid type. Examples of anxiety disorders include, but are not limited to, panic disorder; agoraphobia; a specific phobia; social phobia; obsessive-compulsive disorder; post-traumatic stress disorder; acute stress disorder; and generalized anxiety disorder.

Movement disorders involving: Huntington's disease and dyskinesia associated with 20 dopamine agonist therapy; Parkinson's disease and restless leg syndrome.

Chemical dependencies: for example alcohol, amphetamine, cocaine, opiate, nicotine addiction.

Disorders comprising, as a symptom thereof, a deficiency in cognition: for example, a 25 subnormal functioning in one or more cognitive aspects such as memory, intellect, or learning and logic ability, in a particular individual relative to other individuals within the same general age population. Also, any reduction in any particular individual's functioning in one or more cognitive aspects, for example as occurs in age-related cognitive decline. Examples of disorders that comprise as a symptom a deficiency in cognition that can be treated according to the present invention are dementia, for example Alzheimer's disease, multi-infarct 30 dementia, alcoholic dementia or other drug-related dementia, dementia associated with intracranial tumors or cerebral trauma, dementia associated with Huntington's disease or Parkinson's disease, or AIDS-related dementia; Alzheimer's related dementia; delirium; amnestic disorder; post-traumatic stress disorder; mental retardation; a learning disorder, for example reading disorder, mathematics disorder, post operative cognitive decline, or a 35 disorder of written expression; attention-deficit/hyperactivity disorder; and age-related cognitive decline.

Mood disorders or mood episodes such as: major depressive episode of the mild, moderate or severe type, a manic or mixed mood episode, a hypomanic mood episode; a depressive episode with atypical features; a depressive episode with melancholic features; a depressive episode with catatonic features; a mood episode with postpartum onset; post-stroke depression; major depressive disorder; dysthymic disorder; minor depressive disorder; treatment resistant depression, SSRI-resistant depression, premenstrual dysphoric disorder; post-psychotic depressive disorder of schizophrenia; a major depressive disorder superimposed on a psychotic disorder such as delusional disorder or schizophrenia; a bipolar disorder, for example bipolar I disorder, bipolar II disorder, and cyclothymic disorder. Other CNS disorders involved treatment resistant depression, SSR1 failures, autism and post operative decline.

Other disorders subject to treatment by the invention and which are affected by inhibition of any or all of the D2, 5HT1B, and 5HT2A receptors include those selected from: hypertension, autism, depression (e.g. depression in cancer patients, depression in Parkinson's patients, postmyocardial infarction depression, subsyndromal symptomatic depression, depression in infertile women, pediatric depression, major depression, single episode depression, recurrent depression, child abuse induced depression, and post partum depression), generalized anxiety disorder, phobias (e.g. agoraphobia, social phobia and simple phobias), posttraumatic stress syndrome, avoidant personality disorder, premature ejaculation, eating disorders (e.g. anorexia nervosa and bulimia nervosa), obesity, chemical dependencies (e.g. addictions to alcohol, cocaine, heroin, phenobarbital, nicotine and benzodiazepines), cluster headache, migraine, pain, Alzheimer's disease, obsessive-compulsive disorder, panic disorder, memory disorders (e.g. dementia, amnestic disorders, and age-related cognitive decline (ARCD), Parkinson's diseases (e.g. dementia in Parkinson's disease, neuroleptic-induced parkinsonism and tardive dyskinesias), endocrine disorders (e.g. hyperprolactinaemia), vasospasm (particularly in the cerebral vasculature), cerebellar ataxia, gastrointestinal tract disorders (involving changes in motility and secretion), negative symptoms of schizophrenia, schizoaffective disorder, obsessive compulsive disorder, mania, premenstrual syndrome, fibromyalgia syndrome, stress incontinence, Tourette's syndrome, trichotillomania, kleptomania, male impotence, cancer (e.g. small cell lung carcinoma), chronic paroxysmal hemicrania and headache (associated with vascular disorders).

The present invention also relates to a method for treating a disorder or condition treatable by modulating serotonergic neurotransmission in a mammal, preferably a human, comprising administering to a mammal in need of such treatment a therapeutically effective amount of a compound of the invention, including preferably the compound of Formula I.

Other disorders and conditions subject to treatment by the present invention are delineated in WO 99/52907 to Bright, the disclosure of which is incorporated herein by reference thereto.

The present invention also relates to a pharmaceutical composition for treating the  
5 aforesaid disorders/conditions, among others, comprising a therapeutically effective amount  
of a compound of the invention, including preferably the compound defined by Formula I and  
a pharmaceutically acceptable carrier.

Examples of preferred compounds of the Formula I are those having the absolute  
stereochemical configuration defined as (7R, 9aS)-*trans* or as (7S, 9aS)-*cis*.

10 Examples of specific embodiments of compounds of the Formula I are those set forth  
in Examples 1-110.

In another more specific embodiment, the invention relates to a compound of Formula  
I' as follows:

15 as a racemate, or the (R) and (S) enantiomers thereof, or the *cis* and *trans* isomers thereof,  
wherein X is oxygen or NR, wherein R is hydrogen or (C<sub>1</sub>-C<sub>6</sub>)alkyl;  
R<sup>1</sup> and R<sup>2</sup> are each independently as hereinbefore defined and

20 wherein R<sup>7</sup> is hydrogen or (C<sub>1</sub>-C<sub>3</sub>)alkoxy; R<sup>8</sup> is hydrogen, hydroxy, or (C<sub>1</sub>-C<sub>3</sub>)alkoxy; and R<sup>9</sup> is  
(C<sub>1</sub>-C<sub>3</sub>)alkoxy.

Scheme 1 illustrates a method of preparing compounds of Formula I having the (7R, 9aS)-*trans* or (7S, 9aS)-*cis* stereochemistry. Compounds with a (7S, 9aR) stereochemistry may also be prepared using analogs of said method or the other methods illustrated.

5 Referring to Scheme 1, the known compound Formula II (e.g. Bright WO 99/52907) is combined with the compound of Formula III, under Mitsunobu coupling conditions, in the presence of triphenylphosphine and a compound of the formula  $\text{RO}_2\text{CN}=\text{NCO}_2\text{R}$  wherein R is methyl or ethyl, to form the compound of Formula IV. (See O. Mitsunobu, *Synthesis*, 1 (1981)). Suitable solvents for this reaction include tetrahydrofuran (THF), other ethers and halocarbon solvents, with THF being preferred. This reaction is generally conducted at a

10 temperature from about room temperature to about 65°C, for about 1 to about 24 hours. It is preferably conducted at about 50°C for about 4 to 18 hours.

Reduction of the compound of Formula IV yields the compound of Formula V. This reduction can be accomplished using lithium aluminum hydride or other aluminum hydrides as the reducing agent, in a solvent selected from, diethyl ether and other dialkyl ethers,

15 preferably diethyl ether, at a temperature from about -5°C to about room temperature, for about 0.5 to about 18 hours.

The compound of Formula V can then be converted into the compound of Formula VI by reacting it with methanesulfonyl chloride, in the presence of a tertiary amine base such as triethylamine (TEA), in methylene chloride or another halocarbon solvent, at a temperature

20 from about -5°C to about room temperature, for a period of about 10 minutes to about 2 hours.

Reaction of the resulting compound of Formula VI with a compound of the formula  $\text{HNR}^3\text{R}^4$ , wherein  $\text{R}^3$  and  $\text{R}^4$ , together with the nitrogen to which they are attached, form a ring as depicted in Scheme 1, yields the corresponding compound having Formula VII. Typically,

25 this last reaction is carried out in THF, N,N-dimethylformamide (DMF) or acetonitrile, or a mixture of two or more of the foregoing solvents, at a temperature from about room temperature to about 100°C, for a period from 1 to about 18 hours.

Scheme 2 illustrates a method of preparing compounds of Formula I having the (7R, 9aS)-*trans* or (7S, 9aS)-*cis* stereochemistry. Referring to Scheme 2, the compound of

30 Formula II can be converted into the compound of Formula VIII by reacting it with methanesulfonyl chloride, in the presence of a tertiary amine base such as triethylamine (TEA), in methylene chloride or another halocarbon solvent, at a temperature from about -5°C to about room temperature, for a period of about 10 minutes to about 2 hours. The compound Formula VIII is combined with the compound of Formula III, under basic coupling conditions to

35 form the compound of Formula IX. Suitable bases include sodium hydride, potassium hydride, alkyl lithiums, sodium bistrimethylsilylamides. Suitable solvents for this reaction

EXPRESS MAIL  
EV 323 552 521 US

include tetrahydrofuran (THF), other ethers, dimethylformamide, and N-methylpyrrolidinone (NMP), with NMP being preferred. This reaction is generally conducted at a temperature from about room temperature to about 100°C, for about 1 to about 24 hours. It is preferably conducted between about 70°C and about 100°C. Generally, the reaction is run for a period

5 for about 1 to 24 hours.

Reduction of the compound of Formula IX yields the compound of Formula X. This reduction can be accomplished using lithium aluminum hydride as the reducing agent, in a solvent selected from, diethyl ether and other dialkyl ethers, preferably diethyl ether, at a temperature from about -5°C to about room temperature, for about 0.5 to about 18 hours.

10 The compound of Formula X can then be converted into the compound of Formula XI by reacting it with methanesulfonyl chloride, in the presence of a tertiary amine base such as triethylamine (TEA), in methylene chloride or another halocarbon solvent, at a temperature from about -5°C to about room temperature, for a period of about 10 minutes to about 2 hours.

15 Reaction of the compound of Formula XI with a compound of the formula  $\text{HNR}^3\text{R}^4$  wherein  $\text{R}^3$  and  $\text{R}^4$ , together with the nitrogen to which they are attached, form a ring, as depicted in Scheme 2, yields the corresponding compound having Formula XII. Typically, this reaction is carried out in THF, N,N-dimethylformamide (DMF) or acetonitrile, or a mixture of two or more of the foregoing solvents, at a temperature from about room temperature to about 100°C, for a period from 1 to about 18 hours.

20

Scheme 3 illustrates a method of preparing compounds of the Formula I having the (7*R*, 9*aS*)-*trans* or (7*S*, 9*aS*)-*cis* stereochemistry. Referring to Scheme 3, the compound of Formula II can be converted into the compound of Formula XV by reacting it with a compound of Formula XIV with a suitable base such as potassium t-butoxide in tetrahydrofuran, other ethers, or dimethylformamide, or halocarbon solvents. Suitable bases include sodium hydride, potassium hydride, alkyl lithiums, sodium bistrimethylsilylamides. This reaction is generally conducted at a temperature from about room temperature to about 80°C, for about 1 to about 24 hours. It is preferably conducted at about 60°C for about 1 to 12 hours. Compound of the Formula XIV can be prepared from compound of Formula XIII using a compound of the formula  $\text{HNR}^3\text{R}^4$  wherein  $\text{R}^3$  and  $\text{R}^4$ , together with the nitrogen to which they are attached, form a ring, as depicted in Scheme 3, and a base such as potassium carbonate in a solvent such as acetonitrile. Suitable solvents for this reaction include tetrahydrofuran (THF), other ethers, dimethylformamide, and halocarbon solvents, with acetonitrile being preferred. Suitable bases include sodium hydride, potassium carbonate, sodium carbonate, alkyl lithiums, sodium or lithium bistrimethylsilylamides, LDA. This reaction is generally

conducted at a temperature from about room temperature to about 80°C, for about 1 to about 24 hours. It is preferably conducted at about 60°C for about 1 to 12 hours.

Scheme 4 illustrates a method of preparing compounds of the Formula I having the (7R, 9aS)-*trans* or (7S, 9aS)-*cis* stereochemistry. Referring to Scheme 4, the compound of  
5 Formula XVI can be converted into the compound of Formula XVII by reacting it with compound of Formula XIV with a suitable base such as potassium t-butoxide in tetrahydrofuran, other ethers, or dimethylformamide, or halocarbon solvents. Suitable bases include sodium hydride, potassium hydride, alkyl lithiums, sodium bistrimethylsilylamides. This reaction is generally conducted at a temperature from about room temperature to about  
10 80°C, for about 1 to about 24 hours. It is preferably conducted at about 60°C for about 1 to 12 hours. Compound of the Formula XIV can be prepared from compound of Formula XIII using a compound of the formula HNR<sup>3</sup>R<sup>4</sup> wherein R<sup>3</sup> and R<sup>4</sup>, together with the nitrogen to which they are attached, form a ring, as depicted in Scheme 4, and a base such as potassium carbonate in a solvent such as acetonitrile. Suitable solvents for this reaction include  
15 tetrahydrofuran (THF), other ethers, dimethylformamide, and halocarbon solvents, with acetonitrile being preferred. This reaction is generally conducted at a temperature from about room temperature to about 80°C, for about 1 to about 24 hours. It is preferably conducted at about 60°C for about 1 to 12 hours.

The compound of Formula XVII is then deprotected to form the hydrochloric acid  
20 addition salt of the corresponding compound of Formula XVIII. This can be accomplished using anhydrous hydrochloric acid (HCl) in diethyl ether, another dialkyl ether or a halocarbon solvent at about room temperature. This reaction can also be carried out without a solvent using trifluoroacetic acid, in which case the bitrifluoroacetic acid addition salt is formed. This reaction is generally run from about 2 to about 18 hours.

25 The desired corresponding compound of Formula XX can be formed by reacting the compound of Formula XVIII from the foregoing reaction with the appropriate compound of Formula XIX wherein R<sup>1</sup> and R<sup>2</sup> are as defined above for Formula I, and 1,8-diazabicyclo[5.4.0]-undec-7-ene (DBU). This reaction is typically conducted in pyridine, at a temperature from about 50°C to about 110°C, for a period of about 1 to about 48 hours.

30 Scheme 5 is an alternate method of preparing compounds of a Formula I having the same stereochemistry at positions 7 and 9a as compounds of the Formula XX and wherein the aminomethyl sidechain on the phenoxy group can be attached at any position (i.e. ortha, meta or para) of that group. Referring to Scheme 5, the dihydrochloride salt of the appropriate compound of the Formula XVIII is reacted with syn, anti, or a mixture of the syn  
35 and anti isomers of a compound of the formula

(i.e. the appropriately substituted benzohydroximoyl chloride), in the presence of a base such as DBU, to form the corresponding compound of Formula XXI. Suitable solvents for this reaction include chlorohydrocarbons such as chloroform and methylene chloride. Suitable 5 reaction temperatures range from about -78°C to about 50°C. This reaction is preferably conducted at a temperature from about 20°C to about 40°C, for a period of about 0.5 to about 24 hours.

The resulting compound of Formula XXI can then be converted into the desired final product of Formula XX by reacting it with a strong nucleophilic organic base (e.g. n-butyl 10 lithium) or sodium hydride. This reaction is typically conducted in a solvent such as toluene, DMF or THF, at a temperature from about room temperature to about 110°C for about 1 to 48 hours. Preferably, the solvent is a mixture of toluene and THF and the reaction is carried out at a temperature from about 80°C to about 100°C.

Unless indicated otherwise, the pressure conditions of each of the above reactions is 15 not critical. Generally, the reactions will be conducted at a pressure of about one to about three atmospheres, preferably at about ambient pressure (about one atmosphere).

The compounds of Formula I which are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice 20 to initially isolate a compound of the Formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent, and subsequently convert the free base to a pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a 25 substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent such as methanol or ethanol. Upon careful evaporation of the solvent, the desired solid salt is obtained.

The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the base compounds of this invention are those which form non-toxic acid addition 30 salts, e.g. salts containing pharmacologically acceptable anions, such as hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate or bisulfate, phosphate or acid phosphate, acetate, lactate, citrate or acid citrate, tartrate or bitartrate, succinate, maleate, fumarate, gluconate,

The compound of Formula I may advantageously be used in conjunction with one or more other therapeutic agents, for instance, different antidepressant agents such as tricyclic  
5 antidepressants (e.g. amitriptyline, dothiepin, doxepin, trimipramine, butriptyline, clomipramine, desipramine, imipramine, iprindole, lofepramine, nortriptyline or protriptyline), monoamine oxidase inhibitors (e.g. isocarboxazid, phenelzine or tranylcyclopramine) or 5-HT re-uptake inhibitors (e.g. fluvoxamine, sertraline, fluoxetine or paroxetine), and/or with  
10 antiparkinsonian agents such as dopaminergic antiparkinsonian agents (e.g. levodopa, preferably in combination with a peripheral decarboxylase inhibitor e.g., benserazide or carbidopa, or with a dopamine agonist e.g., bromocriptine, lisdopride or pergolide). It may also be used with acetylcholinesterases such as donepezil. It is to be understood that the present invention covers the use of a compound of Formula I or a physiologically acceptable salt or solvate thereof in combination with one or more other therapeutic agents.  
15 The compound of Formula I and the pharmaceutically acceptable salts thereof, in combination with a 5-HT re-uptake inhibitor (e.g. fluvoxamine, sertraline, fluoxetine or paroxetine), preferably sertraline, or a pharmaceutically acceptable salt or polymorph thereof (the combination of a compound of Formula I with a 5-HT re-uptake inhibitor is referred herein to as "the active combination"), are useful psychotherapeutics and may be used in the  
20 treatment or prevention of disorders the treatment or prevention of which is facilitated by modulating serotonergic neurotransmission such as hypertension, depression (e.g. depression in cancer patients, depression in Parkinson's patients, postmyocardial infarction depression, subsyndromal symptomatic depression, depression in infertile women, pediatric depression, major depression, single episode depression, recurrent depression, child abuse  
25 induced depression, and post partum depression), generalized anxiety disorder, phobias (e.g. agoraphobia, social phobia and simple phobias), posttraumatic stress syndrome, avoidant personality disorder, premature ejaculation, eating disorders (e.g. anorexia nervosa and bulimia nervosa), obesity, chemical dependencies (e.g. addictions to alcohol, cocaine, heroin, phenobarbital, nicotine and benzodiazepines), cluster headache, migraine, pain, Alzheimer's  
30 disease, obsessive-compulsive disorder, panic disorder, memory disorders (e.g. dementia, amnestic disorders, and age-related cognitive decline (ARCD)), Parkinson's diseases (e.g. dementia in Parkinson's disease, neuroleptic-induced parkinsonism and tardive dyskinesias), endocrine disorders (e.g. hyperprolactinaemia), vasospasm (particularly in the cerebral vasculature), cerebellar ataxia, gastrointestinal tract disorders (involving changes in motility  
35 and secretion), negative symptoms of schizophrenia, premenstrual syndrome, fibromyalgia syndrome, stress incontinence, Tourette's syndrome, trichotillomania, kleptomania, male

impotence, cancer (e.g. small cell lung carcinoma), chronic paroxysmal hemicrania and headache (associated with vascular disorders).

Serotonin (5-HT) re-uptake inhibitors, preferably sertraline, exhibit positive activity against depression; chemical dependencies; anxiety disorders including panic disorder, 5 generalized anxiety disorder, agoraphobia, simple phobias, social phobia, and post-traumatic stress disorder; obsessive-compulsive disorder; avoidant personality disorder and premature ejaculation in mammals, including humans, due in part to their ability to block the synaptosomal uptake of serotonin.

Sertraline, (1S-cis)-4-(3,4-dichlorophenyl)-1,2,3,4-tetrahydro-N-methyl-1-naphthalenamine, has the chemical formula C<sub>17</sub>H<sub>17</sub>NCI<sub>2</sub>; its synthesis is described in U.S. Patent 4,536,518 incorporated herein by reference. Sertraline hydrochloride is useful as an antidepressant and anorectic agent, and is also useful in the treatment of depression, chemical dependencies, anxiety obsessive compulsive disorders, phobias, panic disorder, post traumatic stress disorder, and premature ejaculation.

Activity of the active combination as antidepressants and related pharmacological properties can be determined by methods (1)-(4) below, which are described in Koe, B. et al., *Journal of Pharmacology and Experimental Therapeutics*, 226 (3), 686-700 (1983). Specifically, activity can be determined by studying (1) their ability to affect the efforts of mice in escaping a swim-tank (Porsolt mouse "behavior despair" test), (2) their ability to potentiate 15 5-hydroxytryptophan-induced behavioral symptoms in mice *in vivo*, (3) their ability to antagonize the serotonin-depleting activity of p-chloroamphetamine hydrochloride in rat brain *in vivo*, and (4) their ability to block the uptake of serotonin, norepinephrine and dopamine by synaptosomal rat brain cells *in vitro*. The ability of the active combination to counteract 20 reserpine hypothermia in mice *in vivo* can be determined according to the methods described in U.S. Patent 4,029,731.

The compound of the invention may be administered either alone or in combination with pharmaceutically acceptable carriers, in either single or multiple doses. Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solutions and various organic solvents. The pharmaceutical compositions formed thereby can then be readily 30 administered in a variety of dosage forms such as tablets, powders, lozenges, liquid preparations, syrups, injectable solutions and the like. These pharmaceutical compositions can optionally contain additional ingredients such as flavorings, binders, excipients and the like. Thus, the compound of the invention may be formulated for oral, buccal, intranasal, parenteral (e.g. intravenous, intramuscular or subcutaneous), transdermal (e.g. patch) or rectal 35 administration or in a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinized maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycolate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, methyl cellulose or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters or ethyl alcohol); and preservatives (e.g. methyl or propyl p-hydroxybenzoates or sorbic acid).

15 For buccal administration, the composition may take the form of tablets or lozenges formulated in conventional manner.

The compound of the invention may be formulated for parenteral administration by injection, including using conventional catheterization techniques or infusion. Formulations for injection may be presented in unit dosage form, e.g. in ampules or in multi-dose containers, with an added preservative. They may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form for reconstitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

25 In a further aspect, this invention provides compositions of matter suitable for administration to a human patient as a solution (e.g., as an injectable or intranasally), comprising an inclusion complex of a salt of the compounds of the invention in a material such as cyclodextrin. Advantageously, in a preferred embodiment said inclusion complex provides an amount of compound of at least 2.5 mgA/ml when the amount of compound provided by said complex is measured at a cyclodextrin concentration of 40% w/v in water. The inclusion complex of compound in cyclodextrin can first be isolated by drying, usually by lyophilization. The isolated dry inclusion complex can be stored at room temperature for periods up to two years and longer, and reconstituted into a product solution as needed. When a product solution is required, it can be made by dissolving the isolated inclusion complex in water (or other aqueous medium) in an amount sufficient to generate a solution of the required strength for oral or parenteral administration to patients. If parenteral

administration is the chosen route of administration, intramuscular injection is preferred. The compounds may be formulated for fast dispersing dosage forms (fddf), which are designed to release the active ingredient in the oral cavity. These have often been formulated using rapidly soluble gelatin-based matrices. These dosage forms are well known and can be

5 used to deliver a wide range of drugs. Most fast dispersing dosage forms utilize gelatin as a carrier or structure-forming agent. Typically, gelatin is used to give sufficient strength to the dosage form to prevent breakage during removal from packaging, but once placed in the mouth, the gelatin allows immediate dissolution of the dosage form. Alternatively, various starches are used to the same effect.

10 The compound of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g. containing conventional suppository bases such as cocoa butter or other glycerides.

For intranasal administration or administration by inhalation, the compound of the invention is conveniently delivered in the form of a solution or suspension from a pump spray

15 container that is squeezed or pumped by the patient or as an aerosol spray presentation from a pressurized container or a nebulizer, with the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurized container or nebulizer

20 may contain a solution or suspension of the active compound. Capsules and cartridges (made e.g. from gelatin) for use in an inhaler or insufflator may be formulated containing a powder mix of a compound of the invention and a suitable powder base such as lactose or starch. (Other formulations that need to be added are: IM and Fast Dissolve FDDF

A proposed dose of the active compounds of the invention for oral, parenteral or

25 buccal administration to the average adult human for the treatment of the conditions referred to above (e.g. depression) is about 0.1 to about 200 mg of the active ingredient per unit dose which could be administered, for example, 1 to 4 times per day.

Aerosol formulations for treatment of the conditions referred to above (e.g. migraine) in the average adult human are preferably arranged so that each metered dose or "puff" of

30 aerosol contains about 20 mg to about 1000 mg of the compound of the invention. The overall daily dose with an aerosol will be within the range of about 100 mg to about 10 mg. Administration may be several times daily, e.g. 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

In connection with the use of the compound of the invention with a 5-HT re-uptake

35 inhibitor, preferably sertraline, for the treatment of subjects possessing any of the above conditions, it is to be noted that these may be administered either alone or in combination with

pharmaceutically acceptable carriers by either of the routes previously indicated, and that such administration can be carried out in both single and multiple dosages. More particularly, the active combination can be administered in a wide variety of different dosage forms, i.e. they may be combined with various pharmaceutically-acceptable inert carriers in the form of

5 tablets, capsules, lozenges, troches, hard candies, powders, sprays, aqueous suspension, injectable solutions, elixirs, syrups, and the like. Such carriers include solid diluents or fillers, sterile aqueous media and various non-toxic organic solvents, etc. Moreover, such oral pharmaceutical formulations can be suitably sweetened and/or flavored by means of various agents of the type commonly employed for such purposes. In general, the compounds of

10 formula I are present in such dosage forms at concentration levels ranging from about 0.5% to about 90% by weight of the total composition, i.e., in amounts which are sufficient to provide the desired unit dosage and a 5-HT re-uptake inhibitor, preferably sertraline, is present in such dosage forms at concentration levels ranging from about 0.5% to about 90% by weight of the total composition, i.e. in amounts which are sufficient to provide the desired

15 unit dosage.

A proposed daily dose of the compound of the invention in the combination formulation (a formulation containing the compound of the invention and a 5-HT re-uptake inhibitor) for oral, parenteral, rectal or buccal administration to the average adult human for the treatment of the conditions referred to above is from about 0.01 mg to about 2000 mg,

20 preferably from about 0.1 mg to about 200 mg of the active ingredient of Formula I per unit dose which could be administered, for example, 1 to 4 times per day.

A proposed daily dose of a 5-HT re-uptake inhibitor, preferably sertraline, in the combination formulation for oral, parenteral or buccal administration to the average adult human for the treatment of the conditions referred to above is from about 0.1 mg to about

25 2000 mg, preferably from about 1 mg to about 200 mg of the 5-HT re-uptake inhibitor per unit dose which could be administered, for example, 1 to 4 times per day.

A preferred dose ratio of sertraline to an active compound of this invention in the combination formulation for oral, parenteral or buccal administration to the average adult human for the treatment of the conditions referred to above is from about 0.00005 to about

30 20000; preferably from about 0.25 to about 2000.

Aerosol combination formulations for treatment of the conditions referred to above in the average adult human are preferably arranged so that each metered dose or "puff" of aerosol contains from about 0.01 mg to about 100 mg of the active compound of this invention, preferably from about 1 mg to about 10 mg of such compound. Administration may

35 be several times daily, e.g. 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

Aerosol formulations for treatment of the conditions referred to above in the average adult human are preferably arranged so that each metered dose or "puff" of aerosol contains from about 0.01 mg to about 2000 mg of a 5-HT re-uptake inhibitor, preferably sertraline, preferably from about 1 mg to about 200 mg of sertraline. As previously indicated, a 5-HT re-uptake inhibitor, preferably sertraline, in combination with compounds of Formula I are readily adapted to therapeutic use as antidepressant agents. In general, these antidepressant compositions containing a 5-HT re-uptake inhibitor, preferably sertraline, and a compound of Formula I are normally administered in dosages ranging from about 0.01mg to about 100mg per kg of body weight per day of a 5-HT re-uptake inhibitor, preferably sertraline, preferably from about 0.1 mg to about 10 mg per kg of body weight per day of sertraline; with from about 0.001 mg. to about 100 mg per kg of body weight per day of a compound of Formula I, preferably from about 0.01 mg to about 10 mg per kg of body weight per day of a compound of Formula I, although variations will necessarily occur depending upon the conditions of the subject being treated and the particular route of administration chosen.

The following Examples illustrate the preparation of various compounds of the present invention. Melting points are uncorrected. NMR data are reported in parts per million and are referenced to the deuterium lock signal from the sample solvent (deuteriochloroform unless otherwise specified). Specific rotations were measured at room temperature using the sodium D line (589 nm). Commercial reagents were utilized without further purification. THF refers to tetrahydrofuran. DMF refers to N,N-dimethylformamide. Chromatography refers to column chromatography performed using 47-61 mesh silica gel and executed under nitrogen pressure (flash chromatography) conditions. Room or ambient temperature refers to 20-25°C. All non-aqueous reactions were run under a nitrogen atmosphere for convenience and to maximize yields. Concentration at reduced pressure means that a rotary evaporator was used. The Examples are illustrative only; they are not to be construed as limiting the scope, spirit and variations of the invention.

were dissolved in pyridine (16 ml), and then heated (110°C) with stirring for 18 hours. 10% aqueous sodium bicarbonate and methylene chloride (250 ml of each) were added, and the mixture was vigorously stirred. The aqueous phase was then re-extracted with three 100 ml portions of fresh methylene chloride. The combined organic extracts were dried (anhydrous sodium sulfate) and concentrated *in vacuo* to an amorphous solid (4.88 g). Flash chromatography of the entire sample (silica gel, 47-61 micron mesh; elution with methanol/methylene chloride = 6.94 in volume) afforded the title compound (3.46 g, 43% yield) as an amorphous solid. To a solution of the title compound of the previous step (3.05 g, 10.0 mmol), 6-methyl-2-hydroxypicolinate (1.91 g, 12.5 mmol), diethylazodicarboxylate (1.1 ml, 12.0 mmol), and triphenylphosphine (3.14 g, 12.0) were combined in tetrahydrofuran (35 ml). The solution was heated (50°C) and stirred for 18 hours. 10% aqueous sodium bicarbonate and methylene chloride (100 ml of each) were added, and the mixture was vigorously stirred. The aqueous phase was then re-extracted with three 50 ml portions of fresh methylene chloride. The combined organic extracts were, in turn, sequentially extracted with 1N aqueous sodium hydroxide and 10% aqueous sodium bicarbonate. The separated organic phase was dried (anhydrous sodium sulfate) and the solvent was removed *in vacuo*, yielding a tacky solid. Flash chromatography of the sample afforded the title compound (2.14 g, 48% yield) as white solid. Step 5

The general procedure: A reaction mixture consisting of the mesylate title compound from the previous step (0.035 mmol, 17.2 mg) and an appropriate amine (0.15 mmol) in acetonitrile (1 ml) was stirred in a 2-dram vial at 90°C for 12 hours. After cooling, 0.75 mL of sodium hydroxide and 2.2 mL of ethyl acetate was added to each vial. After agitation, the organic layer was separated and passed through  $\text{Na}_2\text{SO}_4$  (6 mL SPE column, 2g). The extraction procedure was repeated 2 more times with methylene chloride. The solvent is removed and the residue dissolved in 1.0 mL of DMSO and filtered through 0.45 MM Nylon Acrodisc into 12X32 mm HPLC vials for purification. the amine (0.15 mmol) in 2-dram vials is added the mesylate and 0.9 mL of dry acetonitrile. The reaction is shaked and heated at 80 °C for 12h in a sealed vial.

Step 3

5           (7R, 9aS)-trans-[5-(2-Benzod]isoxazol-3-yl-octahydro-pyrido[1,2-a]pyrazin-7-ylmethoxy)-pyridin-2-yl]-methanol

To a well stirred, ice bath-chilled partial solution of the title compound of the previous step (991 mg, 2.35 mmol) in tetrahydrofuran (30 ml), a 1.0M tetrhydofuran solution of lithium aluminum hydride (4.7 ml, 4.70 mmol) was added dropwise at 0 °C. The reaction mixture was then vigorously stirred for 1 hour before quenching by cautious dropwise addition (at 0°C) of a total of 1 ml 1N aqueous sodium hydroxide. After stirring at ambient temperature for 30 minutes, the mixture was dried with anhydrous sodium sulfate and then filtered through celite. Solvent removal *in vacuo* followed by flash chromatography of the sample afforded the title compound as a white solid (447 mg; 48% yield). Diagnostic <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) 3.87 (d, 1H, J = 12.9 Hz), 3.96 (d, 1H, J = 12.4 Hz), 4.06 (dd, 1H, J = 10.8 and 5.4 Hz), 4.59 (d, 2H, J = 5.4 Hz), 6.70 (d, 1H, J = 8.8 Hz), 7.17-7.21 (m, 1H), 7.42-7.49 (m, 2H), 7.59 (dd, 1H, J = 8.7 and 2.5 Hz), 7.65 (d, 1H, J = 7.9 Hz), 8.06 (d, 1H, J = 2.5 Hz); MS m/z 395.2 (M+H).

Step 4

20           (7R, 9aS)-trans-Methanesulfonic acid 5-(2-benzod]isoxazol-3-yl-octahydro-pyrido[1,2-a]pyrazin-7-ylmethoxy)-pyridin-2-ylmethyl ester

To a well-stirred mixture of the title compound (148 mg, 0.38 mmol) of the previous step (partially dissolved) and triethylamine (0.1 mL, 0.75 mmol) in methylene chloride (5 ml), at ambient temperature, methanesulfonyl chloride (40 µl, 0.05 mmol) was added. The reaction was then stirred for 1h before quenching with 10% aqueous sodium bicarbonate (with 20 ml of methylene chloride added). The reaction mixture was extracted with three 10 ml fresh portions of methylene chloride. The combined organic extracts were dried (anhydrous sodium sulfate) and concentrated *in vacuo* to afford the title compound as a viscous oil. The product was used in the next step without further purification.

30           Step 5

The general procedure is as follows: A reaction mixture consisting of (7R, 9aS)-trans-Methanesulfonic acid 5-(2-benzod]isoxazol-3-yl-octahydro-pyrido[1,2-a]pyrazin-7-ylmethoxy)-pyridin-2-ylmethyl ester from the previous step (0.03 mmol, 14.2 mg) and an appropriate amine (0.12 mmol) in acetonitrile (1 ml) was stirred in a 2-dram vial at 90°C for 12 hours. After cooling, the solvent is removed and the residue dissolved in 1.8 mL of DMSO and filtered through 0.45 MM Nylon Acrodisc into 12X32 mm HPLC vials for purification.
